

Quick Start — Local Social Media Downloader PRO

v1.2 · \$10 one-time · DigitalToolsStudios

This is a short practical guide for people who already work with local Python scripts and want a clean way to pull supported media into their pipeline. Always respect platform Terms of Service and copyright. Use only with content you have rights to process.

1. Get the package

Buy the \$10 ZIP on Gumroad: <https://digitaltoolsstudios.gumroad.com//localsocialdownloader>

You receive a downloadable archive with the tool and README.

2. Setup (typical)

```
python -m venv .venv
source .venv/bin/activate          # Windows: .venv\Scripts\activate
pip install -r requirements.txt
```

3. Run (illustrative)

```
python main.py --url "https://..." --out ./downloads
```

Exact flags and supported URL patterns are documented inside the package you receive. Unsupported or private content fails with a clear message.

4. Fit into your scripts

The design goal is that the tool becomes one step in a larger local workflow: download → rename → organize → further processing. It is not meant to replace your whole content system.

5. Legal reminder

This is a utility for supported workflows. It does not grant permission to download content you do not own or lack a license for. Platform rules and copyright law still apply.
